## Introducing Portrait® PSR Clinically proven to reduce wrinkles, tighten and improve skin tone and texture

Portrait® is effective in reducing the look of fine lines and deep wrinkles, treating sun-damaged skin, improving skin texture, reducing pore size, and tightening skin. The results are comparable to laser resurfacing but the downtime is dramatically reduced. Portrait keeps working, stimulating collagen production and reducing the effects of sun damage with continued improvement of the skin for up to one year. The Portrait treatment repairs the architecture of the skin for true, high quality, long-lasting improvement. It activates collagen production at the surface of the skin while also stimulating the formation of a fine network of collagen fibers deep within the architecture of the skin.

Portrait is the first and only clinically proven nitrogen plasma energy FDA-cleared technology that delivers true skin regeneration through a unique thermal profile extending deep into the dermis. The results are backed by more than 16 clinical studies.
